

# Geometry and Topology in Data Science (Spring 2024)

## Organization

- **The Organizers:** Marzieh Eidi, Diaaeldin Taha
- **MPI Seminar Page:** [Mathematical Methods in Data Science](#)
- **Contact:** To contact the organizers, email the lab at `lab [at] mis [dot] mpg [dot] de`.
- **Mailing List:** To stay informed of Lab activities, including this group's meetings, join the [Lab mailing list](#).

## Schedule

Week	Date	Time	Location	Speaker	Title
Week 19	Fri 10.05	09:00–10:30	E1 05	Justin Curry	“To Predict is NOT to Explain”
Week 20	Fri 17.05	—	—	—	<a href="#">CAG Conference</a> - <b>NO MEETING</b>
Week 21	Fri 24.05	09:00–10:30	G3 10	Celia Hacker	What are Graph Neural Networks?
Week 22	Fri 31.05	09:00–10:30	G3 10	Jeff Philips	The Geometry of Kernel Methods and Kernel Range Spaces
Week 23	Fri 07.06	09:00–10:30	E1 05	Simon Telen	Chebyshev varieties
Week 24	Fri 14.06	09:00–10:30	G3 10	Parvaneh Joharinad	Mathematical Foundations of Dimensionality Reduction
Week 25	Fri 21.06	09:00–10:30	E1 05	Bei Wang	Topology-Preserving Data Compression
Week 26	Fri 28.06	—	—	—	<a href="#">ScaDS Summer School</a> - <b>NO MEETING</b>
Week 27	Fri 05.07	09:00–10:30	E1 05	Marzieh Eidi	Quantitative and Qualitative Mathematical Data Analysis
Week 28	Fri 12.07	09:00–10:30	E1 05	Karel Devriendt	Spanning Trees, Effective Resistances and Curvature on Graphs

## Abstracts

### Week 19

**Speaker:** [Justin Curry](#) (University of Albany, USA)

**Coordinates:** [Fri 10.05, 9–10:30 AM, MiS E1 05](#)

**Title:** “To Predict is NOT to Explain”

**Abstract:** Modern day neural networks are amazing prediction machines, but to get at explanations one has to understand higher order relations between data as they fiber over their predictions. In this talk I will connect the urgent questions of modern data science with the distinguished history of applied topology by considering simple geometric examples and probing them with increasingly complicated tools. Ideas from dynamics, stratification theory and sheaf theory will be introduced in a

loose and intuitive fashion to trace future directions for research.

## Week 20

[CAG Conference](#) - **NO MEETING**

## Week 21

**Speaker:** Celia Hacker (Max Planck Institute for Mathematics in the Science, Germany)

**Coordinates:** [Fri 24.05, 9-10:30 AM, G3 10](#)

**Title:** What are graph neural networks?

**Abstract:** Graph structured data appears in many different context and with this comes the need for tools to analyse them. One of the most common tools to study data sets of graphs are graph neural networks (GNNs). However, to many of us GNNs remain a black box that magically perform predictions about graphs. In this lecture we will learn about the basics of GNNs, possible generalizations and research directions.

## Week 22

**Speaker:** [Jeff Phillips](#) (University of Utah, USA)

**Coordinates:** [Fri 31.05, 9-10:30 AM, MiS G3 10](#)

**Title:** The Geometry of Kernel Methods and Kernel Range Spaces

**Abstract:** I will start by overviewing kernel methods in machine learning, and how the simple kernel trick allows one to effortlessly turn intuitive linear methods into non-linear ones. While these methods can seem mysterious, I'll try to give insight into the geometry that arises, especially in kernel SVM. This will lead into kernel range spaces, which describes all the ways one can inspection a data set with a kernel. From there I will discuss approximation of these with coresets, and just approximating the spaces themselves which leads to surprising results in high dimensions.

**Speaker Bio:** Jeff Phillips is a Professor in the School of Computing at the University of Utah. He founded the [Utah Center for Data Science](#), and directs the [Data Science academic program](#) there. He works on geometric data analysis, algorithms for big data, and how these intersect with data science. His book, [Mathematical Foundations for Data Analysis](#), was published by Springer-Nature in 2021.

## Week 23

**Speaker:** [Simon Telen](#) (Max Planck Institute for Mathematics in the Science, Germany)

**Coordinates:** [Fri 07.06, 9-10:30 AM, MiS E1 05](#)

**Title:** Chebyshev Varieties

**Abstract:** Chebyshev varieties are algebraic varieties parametrized by Chebyshev polynomials. They arise naturally when solving polynomial equations expressed in the Chebyshev basis. More precisely, when passing from monomials to Chebyshev polynomials, Chebyshev varieties replace toric varieties. I will introduce these objects, discuss their defining equations and present key properties. Via examples, I will motivate their use in practical computations. This is joint work with Zaïneb Bel-Afia and Chiara Meroni.

**Week 24**

**Speaker:** Parvaneh Joharinad (Max Planck Institute for Mathematics in the Science, Germany)

**Coordinates:** [Fri 14.06, 9-10:30 AM, G3 10](#)

**Title:** Mathematical Foundations of Dimensionality Reduction

**Abstract:** Dimensionality reduction is a crucial technique in data analysis and machine learning, enabling the simplification of complex high-dimensional datasets while preserving their intrinsic structures. In this talk we will present the mathematical footings of several prominent dimensionality reduction methods: Principal Component Analysis (PCA), Isomap, Laplace Eigenmaps, etc. We will explore the specific optimization objectives and the role of weight assignments within k-neighborhood graphs for each method. By examining the theoretical frameworks and optimization processes, we aim to provide a comprehensive understanding of how these techniques transform metric relationships within data into meaningful lower dimensional representations. Insights into the mathematical principles that drive these algorithms highlight their unique approaches to capturing and preserving data structures.

**Week 25**

**Speaker:** [Bei Wang](#) (University of Utah, USA)

**Coordinates:** [Fri 21.06, 9-10:30 AM, MiS E1 05](#)

**Title:** Topology-Preserving Data Compression

**Abstract:** Existing error-bounded lossy compression techniques control the pointwise error during compression to guarantee the integrity of the decompressed data. However, they typically do not explicitly preserve the topological features in data. When performing post hoc analysis with decompressed data using topological methods, preserving topology in the compression process to obtain topologically consistent and correct scientific insights is desirable. In this talk, we will discuss a couple of lossy compression methods that preserve the topological features in 2D and 3D scalar fields. Specifically, we aim to preserve the types and locations of local extrema as well as the level set relations among critical points captured by contour trees in the decompressed data. This talk is based on joint works with Lin Yan, Xin Liang, Hanqi Guo, and Nathan Gorski.

**Speaker Bio:** Dr. Bei Wang Phillips is an Associate Professor in the School of Computing and a faculty member in the Scientific Computing and Imaging (SCI) Institute, University of Utah. She obtained her Ph.D. in Computer Science from Duke University. Her research focuses on topological data analysis, data visualization, and computational topology. She works on combining topological, geometric,

statistical, data mining, and machine learning techniques with visualization to study large and complex data for information exploration and scientific discovery. Some of her current research activities involve the analysis and visualization of high-dimensional point clouds, scalar fields, vector fields, tensor fields, networks, and multivariate ensembles. Dr. Phillips is a DOE Early Career Research Program (ECRP) awardee in 2020 and an NSF CAREER awardee in 2022. Her research has been supported by multiple awards from NSF, NIH, and DOE.

## Week 26

[ScaDS Summer School](#) - **NO MEETING**

## Week 27

**Speaker:** [Marzieh Eidi](#) (ScaDS.AI, Germany)

**Coordinates:** [Fri 05.07, 9-10:30 AM, MiS E1 05](#)

**Title:** Quantitative and Qualitative Mathematical Data Analysis: Examples, differences, and connections.

**Abstract:** In this talk, I am going to present a hopefully intuitive (and less technical) overview of some powerful geometric, topological and stochastic methods for analyzing the shape, and structure of complex data. These methods are becoming more and more popular in complex network analysis and machine learning. After presenting some of the main applications, I will present the idea of how these methods are connected, and in particular, what is a connection between geometry and topology, and how we can consider topology as a fluid geometry? And what are some of the main applications of this dynamic viewpoint?

## Week 28

**Speaker:** [Karel Devriendt](#) (Max Planck Institute for Mathematics in the Science, Germany)

**Coordinates:** [Fri 12.07, 9-10:30 AM, MiS E1 05](#)

**Title:** Spanning Trees, Effective Resistances and Curvature on Graphs

**Abstract:** Kirchhoff's celebrated matrix tree theorem expresses the number of spanning trees of a graph as the maximal minor of the Laplacian matrix of the graph. In modern language, this determinantal counting formula reflects the fact that spanning trees form a regular matroid. In this talk, I will discuss some consequences of this perspective for the study of a related quantity from electrical circuit theory: the effective resistance. I will give a new characterization of effective resistances in terms of a certain polytope and discuss applications to recent work on discrete notions of curvature based on the effective resistance.
